Lymphocyte mPNA was converted to TDNA and Subjected to PCP amplification using primers specific for heavy and light chain distributes the amplification products were inserted into a distribution vector to produce a library of fragments. E.coli XLI Blue cells were transformed with the library. Filamentous phage were produced which expressed the MAD regions on their surface. Panning with gp120 and gp41 resulted in the recovery of immunoreactive clones. The light chain VL region sequence PS425 neutralises HIVI

The sequences given in R50215-19 represent the heavy and light chain variable domains of various clones of a human monoclonal antibody which binds to an epitope or glyroprotein F of respiratory syncitial virus (RSV). These antibodies may be used as a reagent for the diagnosis of RSV disease and other viral mucosal diseases. equificance virus, rhinovirus and coronavirus. They are particularly useful in ameliorating RSV when delivered directly to the lungs, and may also be used for treating pneumonia and bronchiolitis.

Example: Fig 11: 366pp; and decention of miv intection.

The sequences given in W01261-92 represent the light chain variable regions (VL) of a series of monoclonal antibodies (Mah's) which are immunoreactive with HIV glycoprotein gpl20 and are capable of neutralising HIV. This sequence represents the sequence of the JK2 gene clone, B20. A MAb containing this VL sequence has the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 nq of antibody. The MAb may be used for determining immunocompetence of a human anti-HIV sequence 107 AA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0
                                                                                                                                                                                                                                                                                                                    Wew human monoclonal antibodies neutralising HIV - react with gpl20 or gp41 and nucleic acid encoding them, useful for in vivo or in vitro diagnosis and for passive immuno-therapy or in vitro diagnosis and for passive immuno-therapy lexample; Page 186; 248pp; Engilsh Lymphocyte mPNA was converted to CDNA and subjected to PCP amplification using primers specific for heavy and light chain variable regions. The amplification products were inserted into a dicistronic vector to produce a library of fragments. E.coli XLI Blue cells were transformed with the library. Filamentous phage were produced which expressed the MAD regions on their surface. Panning with gpl20 and gp41 resulted in the recovery of immunoraactive clones. The light chain VK region sequence R54316 neutralises HIVI

Example: Fig 11, 366pp. English.

Example: Fig 11, 366pp. English.

The sequences given in Wul261-92 represent the light chain variable regions (VI) of a series of monoclonal antibodies (Mbb's) which are immunoreactive with HIV glycoprotein gpl20 and are capable of neutralising HIV. This sequence represents the sequence of the JK2 gene clone, bc. A Mb containing this VL sequence as the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 ng of antibody/mi, and hinds mature gpl20 preferentially over the precursor gpl50. The MAb mature gpl20 preferentially over the precursor gpl50. The Mab mature gpl20 preferentially over the precursor gpl50. The Mab mature gpl20 preferentially over the precursor gpl50. The Mab mature gpl20 preferentially over the precursor gpl50. The Mab mature gpl20 preferentially over the precursor gpl50. The Mab mature gpl20 preferentially over the precursor gpl50. The Mab mature gpl20 preferential graph of HIV infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New human monoclonal antibodies neutralising HIV - react with PP12 94-13516/16.

New human monoclonal antibodies neutralising HIV - react with TP120 or gf41 and nucleic acid encoding them, useful for in vivo or in vitro diagnosis and for passive immuno-therapy.

Stample: Page 177-178: 248pp: English.

Cymphocyte mRNA was converted to CDNA and subjected to PCR amplification using primers specific for heavy and light chain variable regions. The amplification products were inserted into a dicistronic vector to produce a library of fragments. E.coli XLI blue cells were transformed with the library. Filamentous phage were produced which expressed the MAD regions on their surface. Panning with gpl20 and gp41 resulted in the recovery of immunoreactive closes. The light chain VK region sequence R54307 is from a gpl20-

                 DNA segments encoding monoclonal antibody - which binds to gp120 and neutralises HIV, for treating AIDS, and for diagnosing and monitoring HIV infection

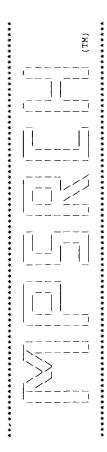

Disclosure, Fage 74-75, 109pp, English.

The nucleotide sequence of FIOS Vk (Q42707 - sequence differs from other FIOS Vk sequences given elsewhere in the specification) was compared with germline gene HimwklaS (Q42705), showing 97-78 similarity. By nucleotide sequence analysis, FIOS appears to be derived from a member of the Vk III subgroup gene family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     10-NOV-1994 (first entry)
Anti-HIV gpl20 immunoglobulin light chain variable region b24.
Human immunodeficiency virus: HIVI; glycoprotein gpl20; epitope; neutralisation; monoclonal antibody; kappa light chain; variable region; framework; complementarity determining region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DB 10; Length 108;

This sequence represents the sequence of the JKI gene clone, b24. A MAb containing this VL sequence has the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 ng of antibody/Mi, and binds mature gpl20 preferentially over the precursor gpl60. The MAb

VI region of HIV neutralising MAb, clone b24.
Heavy chain: light chain; variable region; VH: monoclonal antibody: MAb; HIV; human immunodeficiency virus; glycoprotein; gp120; clone: virus infectivity assay; precursor gp150; immunocompetence; human; anti-HIV antibody; detection; HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

Example: Fig 11, 366pp. English.

The sequences given in W01261-92 represent the light chain variable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       binds mature gp120 preferentially over the precursor gp160. The may be used for determining immunocompetence of a human anti-HIV antibody and in the detection of HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      91.7%; Score 692; DB 19; Length 108;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Indels

*superfamily immunoglobulin V region: immunoglobulin homology autoantibody; chronic lymphocytic leukemia: heterotetramer;
   Kipps, T.J.: Tomhave, E.: Chen, P P: Carson, D A J. Exp. Med. (1988) 167:840-852
Autoantibody-associated kappa light chain variable region gene expressed in chronic lymphocytic leukemia with little or no somatic mutation. Implications for etiology and
  An immunoglobulin heterotetramer subunit consists of two identical light (kappa or lambda) and two identical heavy (alpha, delta, epsilon, gamma, or mu) chains usually stabilized by interchain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into larger
  idues 1.129 ##label KIP
The protein is one of the surface immunoglobulin M autoantibodies expressed in patients with chronic lymphocytic leukemia.

    Immunol. (1989) 142:3158-3163
    Structural and idiotypic characterization of the L chains of
human 19M autoantibodies with different specificities.

  gene expressed in chronic lymphocytic leukemia with little or no somatic mutation. Implications for eticlody and
  An immunoglobulin heterotetramer subunit consists of two identical light (Kappa or lambd) and two identical heavy (alpha, delta, epsilon, gamma, or mu) chains usually stabilized by interchain disulfide bonds. In some cases,
  The protein is one of the surface immunoglobulin M autoantitudies expressed in patients with chronic lymphocytic loukemia.

   J. Immunol. (1989) 142:3158-3163
Structural and idiotypic characterization of the L chains of
human IqM autoantibodies with different specificities.
  .;
  Andrews, D W : Capra, J D
Blochemistry (1981) 20:5816-5822
Blochemistry (1981) 20:5816-5822
Andrio acids sequence of the variable regions of light chains from two idiotypically cross-reactive human IgM anti-gamma-globulins of the Wa group.
  An immunoglobulin heterotetramer subunit consists of two identical light (Rappa or lambda) and two identical heavy (alpha, delta, epsilon, gamma, or mu) chains usually stabilized by interchain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into larger

   Sequence 99, Application US/08276852
Patent No. 5653138
GENERAL INFORMATION:
APPLICANT: Burbon, Dennis R
APPLICANT: Burbon, Carlos F
APPLICANT: Lerner, Richard A
TITLE OF INVENTION: HUMAN NEUTRALIZING MONOCLONAL ANTIBODIES
NUMBER OF SEQUENCES: 170
  ADDRESSEE: The Scripps Research Institute, Office of ADDRESSEE Patent Counsel STREET: 10466 No. 5652138th Torrey Pines Poad, Suite 220, STREET: Mail Drop 106
   Length 108;
  SOFTWARE: Patentin Release #1.0, Version #1.25
CUPRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/276.862
FLING DATE: 18-JUL-1994
CLASSIFICATION 514
PRIOR APPLICATION DATA:
APPLICATION NUMBER: US 08/178,302
FLING DATE: 30-SEP-1993
PRIOR APPLICATION DATA:
APPLICATION NUMBER: US 07/954,148

  Example 5; Fig 16; 104pp; English.

This sequence is deduced from the CDNA clone 4B9-Vk15 and includes the sequence is deduced from the first stop codon ["x" in the sequence represents a nonsense codon). The clone is incomplete, starting from the G of the ATG initiator codon, but the initial Met is given. Antibody molecules of the invention can include one or two produce heavier antibodies. These heavier antibodies were found to have higher avaidity than antibodies with just a single copy of the L'V region. The antibodies can be used to treat disease, e.g. infection by Streptococcus agalactiae. They are able to pass across

  2; Gaps
   Example 4: Fig 17: 104pp; English.

This sequence is derived from the nucleotide sequence encoding the light chain variable region. The "x" residues represent nonsense codons. The coding sequence has been translated in all 3 reading frames (see also P1213 and P12131). The L'V region is duplicated in so-called "aberrant" light chains (see 011878), conferring increased avidity on antibodies comprising such aberrant chains.
   Oligomeric immunoglobulin(s) with high avidity for antigen(s) formed by duplicating esp. variable region of light chain of 1g{\rm G}

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred No is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed,

and is derived by analysis of the total score distribution.

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

(NICH-) NICHOLS INSI DIAGNOSTICS.
MClachian SM. Rapoport B:
  Graves ophthalmopathy associated immunoglobulin protein; orbital antigen; monoclonal antibody; heavy chain; H cha
   consists of a DNA molecule having two cassettes to express two soluble proteins a heavy chain and a light chain. The vector comprises, operatively linked 5' to 3', a first cassette consisting of the phoA
  This sequence represents the expression vector, pPho-TT which is a modified version of the phagemid expression vector, pComb3 given in 092546. pPho-TT provides for the expression of soluble Fabs which are secreted into the periplasmic space which is regulated from the alkaline

  a human anti-tetanus toxoid immunoglobulin (1g) encoded by a Pcomb3 based expression vector. The heavy and light chain variable domains are used in an example to demonstrate the prodn. of antibodies for an antibody library using mutagenic primers. Mutagenic primers of the invention have sequences at their 3' and 5' ends both capable of binding different framework regions linked by a sequence 6 to 50 nucleotides long. Different immunoglobulins produced using the primers may be used to produce antibody libraries having diverse and
   novel immunospecificities and affinities. By using mutagenic ONs an extremely large population of different randomised binding sites can be created and use of the universal light chain increases the number
  Oligo-nucleotide(s) for inducing mutagenesis in an Ig light chain gene CDR - useful for prodn. of Ig heavy and light chain combinatorial antibody libraries

   ccoin This plasmed was used within the scope of the Invention to express cc various mutagenised human Fab's which comprise heavy and light variable creations which bind to HIV 9pi20. pComb3 allows for both surface display cand soluble forms of the Fabs. The vector was designed for the cloning combinatorial Fab libraries. pComb consists of a DNA molecule having cc two cassettes to express one fusion protein, Fd/cp3, and one soluble protein, the light chain. The finished vector comprises, operatively cc linked 5' to 3', a first cassette consisting of lac2 promoter/operator sequences, a NotI restriction site, a ribosome binding site (RBS), a cc gell ladder, a spacer region, a cloning region bordered by 5' XhoI and Cc PalB ladder, a spacer region, a cloning region bordered by 5' Sand a second lac2 promoter/operator sequence, the sequences encoding between the two cassettes, and a second lac2 promoter/operator sequence, cloning region bordered by 5' Saol and 3' XbaI restriction sites, and control RBS, a PelB leader, a spacer region, a cloning region by 5' Saol and 3' XbaI restriction sites.

   HIV-induced disease Example 1; Page 185-188; 249pp; English.
This sequence represents the pComb3 phagemid expression vector. This vector has been designed to allow for anchoring of expressed proteins on the bacteriophage coat protein 3. Gene III of filamentous phage encodes the 406 residue minor phage coat protein, opl11 (cp3), which is expressed prior to extrusion in the phage assembly process on a bacterial membrane and accumulates on the inner membrane facing into the periplasm of E.

   Disclosure; Fig 2; 35pp; English.

The sequences given in 035099-100 encode the heavy and light chains of Antibody D respectively. Antibody D is a monoclonal antibody which was derived from peripheral blood lymphocytes from a hepatitis A virus (HAV) sero positive patient. Antibody D is closely related in nature to murine antibody B5B3. Total RNA was extracted. These polyA expressing cells and polyadenylated RNA was extracted. These polyA NA's were used to prepare a cDNA library which was screened for human kappa light (L) chains and two positive clones were detected.
  Further heavy (H) chain clones were also isolated. Sequence 1617 BP; 375 A; 526 C; 441 G;

  PT P-selectin and opt. E-selectin binding organic mol. - having stialy1-Le(x) and sulphated determinant, useful for protecting against inflammatory or immune reactions
PT against inflammatory or immune reactions
PS Disclosure; Page 40-41: 81pp; English.
The gene (760739) encoding IgG1 (W10550) can be subjected to site-
CC The gene (760739) encoding IgG1 (W10550) can be subjected to site-
CC directed mutagenesis in order to introduce one or more N-linked 
CC diverted mutagenesis into the IgG1 molecule (see also W10551).
CC Eukaryotic host cells co-transfected with a vector carrying the 
CC the mutated IgG1 gene and with a vector that expresses an alpha-
CC (1.3) fucosyltransferase capable of attaching sialy1-Le(x) groups at 
CC the glycosylation sites of the antibody molecule can be used in the 
CC prodn. of slaly1-Le(x)-modified antibody. Such an antibody has 
CC therapeutic applns., e.g. in minimising inflammation and 
CC decreasing extravasation-dependent organ damage and/or clotting.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

  Disclosure: Fig 2: 35pp; English.

The sequences given in Q35099-100 encode the heavy and light chains of Antibody D respectively. Antibody D is a monoclonal antibody which was derived from peripheral blood lymphocytes from a hepatitis A virus (HAV) sero positive patient. Antibody D is closely related in nature to murine antibody B5B3. Total RNA was solated from antibody D expressing cells and polyadenylated RNA was extracted. These polyARNA's were used to prepare a cDNA library which was screened for human kappa light (L) chains and two positive clones were detected.

   sub:unit of varicella zoster virus - used in a therapy and prophylaxis of infection Claim 14: Fig 4B; 39pp: English.

Claim 14: Fig 4B; 39pp: English.

A human anti-Varicella zoster virus monoclonal antibody was prepd.

using the trioma method of ostberg et al. (1983) Hybridoma 2:361-367.

One resultant trioma neutralised VZV in the absence of complement. This cell line, designated cell line TC93KA9, produced an antibody designated 93KA9. cDNA for the light and heavy chain variable region
   Q89329 standard; DNA;
  genes of the 93KA9 antibody were cloned using PCR. At least two heavy chain (gamma-1) and two light chain (Kappa) specific clones were sequenced (see 082749 & 082750 respectively).

   by molecular cloning of immunoglobulin genes by PCR Claim 25; Page 68; 94pp; English.

L. and H-chain DNA was amplified by PCR from Graves' orbital tissue and clones encoding autoimmune-associated immunoglobulin fragments were obtained. 13/15 clones of H chain (1961) genes showed homology to the closest germline genes, DP10 (089327) and hv1263 (089328). The DNA (089329) and corresp. amino acid (R72070) sequences of the VH region of a representative clone, OF7H1.2, are provided.
   Graves' ophthalmopathy-associated monoclonal antibody by molecular cloning of immunoglobulin genes by PCR

committed the second control of the Example 1; Page 83; 125pp; English.

Example 1; Page 83; 125pp; English.

T15202 and T15203 are the heavy and light chain variable domains of a human anti-tetanus texcid immangicbulin (13) encoded by a Prombib based expression vector. The heavy and light chain variable domains are used in an example to demonstrate the production of antibodies for an antibody library using mutagenic primers. Mutagenic primers of the invention have sequences at their 3' and 5' ends both capable of invention have sequences at their 3' and 5' ends both capable of the sequence of the s
   gp120, useful for passive immunotherapy or product of anti-idiotype vaccines. Claim 11: Page 21-20: 34pp; English.
The monoclonal antibodies (MAb's) designated GP13, GP44 and GP58 react with HIV-1 gp120 glycoprotein variants containing the amino acids Asn88, Lys117, Asn252 and Tyr 435 but exhibit at least 50% reduced reacion with gp120 variants in which these amino acids have been deleted or substituted. The MAb's are useful for passive have been deleted or substituted. The MAb's are useful for passive

PS Example 1; Page 188: 249pp; English.

This sequence represents the pComb3 phagemid expressed proteins on vector has been designed to allow for anchoring of expressed proteins on the bacteriophage coat protein 3. Gene III of filamentous phage encodes the 406 residue minor phage coat protein, cpIII (cp3), which is expressed prior to extrusion in the phage assembly process on a bacterial membrane and accumulates on the inner membrane facing into the periplasm of E. Cooli. This plasmid was used within the scope of the invention to express various mutagenised human Fab's which comprise heavy and light variable regions which bind to HIV wpl20. pComb3 allows for both surface display and soluble forms of the Fabs. The vector was designed for the cloning of combinatorial Fab libraries. pComb consists of a DNA molecule having two cassettes to express one fusion protein, Fd/cp3, and one soluble protein, the light chain. The finished vector comprises, operatively linked; to 3', a first cassette consisting of lacz promoter/operator

Human lung cancer specific antibody heavy chain variable region cDNA.
Heavy chain, light chain, variable region; human; monoclonal antibody;
lung cancer fissue; diagnosis; purification; cancer-specific antigen; ss.
Homo saplens.
  Antibody specifically reactive to human lung cancer cells - also corresponding DNA, used to diagnose cancer, or for purification of cancer-specific antigen claim 1: Fig 1: 9pp; Japanese.

The sequences given in 145035-36 encode the heavy chain and light chain variable regions from a human monoclonal antibody which is specific for human lung cancer lissue. The monoclonal antibody wish be used for clinical diagnosis of cancers, for immunological therapy

   Provided the production of human immunoglobulin by genes - for the production of human immunoglobulin in mammalian hosts

Production of human immunoglobulin in mammalian hosts

Disclosure; Page 67-68: 130pp; Japanese.

A series of genes (77893-7902) encoding human immunoglobulin variable heavy chains. The genes were isolated and cloned from a series of cosmid constructs: v202: v103; v21: v6;v24; 3-31; M84; M18 and M131, by PCR amplification using primers (78917-38. The genes are subdivided into 5 families of Vh genes. The fragments cover a region of 800 kb. The DNA is against a region of 800 kb. The DNA pacents. The DNA was partially digested with Tag1 restriction enzyme. The fragments were separated by gel electophoresis and 35-45 kb fractions were collected. The fragments were in vitro packed and infected vector pJB81. The ligation products were in vitro packed and infected hypridisation. The Vh genes and the DNA fragments encoding them are useful in producing human immunoglobulin mammalian hosts.

fragments were isolated from high molecular weight DNA from human placenta. The DNA was partially digested with TagI restriction enzyme. The fragments were separated by gel elecrophoresis and 33-45 kb fractions were collected. The fragments were ligated with Clalf-digested cosmid vector pJB81. The ligation products were in vitro packed and infected into E.coli 490A. The fragments were then subcloned by colony hybridisation. The Vh genes and the DNA fragments encoding them are useful in producing human immunoglobulin in mammalian hosts.
   production of human immunoglobulin in mammalian hosts Claim 62; Page 102-103; 130pp; Japanese. A series of genes (078939-79002) encoding human immunoglobulin variable heavy chains. The genes were isolated and cloned from a series of cosmid constructs: Y202; Y103; Y21; Y6;Y24; 3-31; M84; M118 and M131, by PCR amplification using primers 078917-38. The genes are subdivided into 5 familles of Vh genes. The fragments cover a region of 800 kb. The DNA

production of human immunoglobulin vh genes - for the production of human immunoglobulin in mammalian hosts

production of human immunoglobulin in mammalian hosts

production of human immunoglobulin in mammalian hosts

production of human immunoglobulin in mammalian hosts

production seq 67893-79602 percoding human immunoglobulin variable heavy chains. The genes were isolated and cloned from a series of cosmid constructs: Y.702, Y103, Y11, Y6,Y24; 31, M84, M18 and M13, by pore amplification using primers 07891-38. The genes are subdivided into 5 families of Vh genes. The fragments cover a region of 800 kb. The DNA companies of vh genes are isolated from high molecular weight DNA from human placenta. The DNA was partially digested with Tag1 restriction enzyme. The fragments were separated by gel electrophoresis and 35-45 kb fractions were collected. The fragments were ligated with clai-digested cosmid vector pubBl. The ligation products were invitro packed and infected into E.coli 490A. The fragments were then subcloned by colony hybridisation. The Vh genes and the DNA fragments excelling them are

   Production of human immunoglobulin Whydons - for the production of human immunoglobulin in mammalian hosts production of human immunoglobulin in mammalian hosts bisclosure; Page 81-82, 100gp, Japanese.

S series of genes (1789-979002) encoding human immunoglobulin variable constructs: V102, V13, V21, V6,V24, 313, M84, M18 and M131, by PCR amplification using primers (78917-38 The genes are subdivided into 5 families of Whydenes. The fragments cover a region of 800 kb. The DNA from high molecular weight DNA from human placenta. The DNA was partially digested with Tagl restriction enzyme. The fragments were lagated with Tagl restriction enzyme. The fragments were lagated with Clail digested cosmid vector pJ881. The ligation products were in vitro packed and infected into E.coli 490A. The fragments were then subcloned by colony cutor placent. The Vigness and the DNA fragments are useful in producing human immunoglobulin in mammalian hosts.
  Antibody containing immunoglobulin heavy chain mutation - with thyroid function stimulating activity Claim 1: Page 12: 18pp: Japanese. T79919-T79922 represent the immunoglobulin heavy and light chain variable
  regions isolated from peripheral blood lymphocyte strains. These agequences were isolated from the B6H3 and 101-2 strains of peripheral blood lymphocytes of a Basedow's disease patient. These sequences are replaced, deleted or inserted into an antibody, to create the antibodies of the invention. The antibodies of the invention have thyroid function stimulating activity, and act by combining with thyrotropin receptor The antibody can be used in a method to detect autoantibodies which have

   anti-rhesury and for passive immunisation of monoclonal antibodies and for passive immunisation of monoclonal antibodies and for passive immunisation. Of monoclonal possible sand for passive immunisation of monoclonal antibodies are represented in 019145-57. Synthetic genes, for both heavy and light chains may be created by combining selected CDR 1, 2, and 3 regions, which may be selected from different antibody mois. Having varied binding specificity. The chimaeric anti-RhD antibodies can be used for diagnosis and therapy, and are capable of providing bloodby typing reagents of high specificity and reliability. They can also be used in passive immunisation to prevent haemolytic disease of the

/Organism="Homo sapiens"
//Organism="Homo sapiens"
//Organismixed (see below): Vector: pT7T3D-Pac
(Pharmacia) with a modified polylinker; Site_1: Not I;
Site_2: Eco RI: Equal amounts of plasmid DNA from three normalized libraries (melanocyte 2NbHM, pregnant uterus NbHPU, and fetal heart NbHHM) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction
  abl2f07.rl Stratagene lung (#937210) Homo sapiens cDNA clone 840613

Pred No is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of a modified pT713 vector (Pharmacia). Library went through one round of normalization to a Cot * 20. Library constructed by Rento Scares and M.Patima Bonaldo.
